

QUICK SORT & MERGE SORTAIM

write a menu driven C program to implement Quick sort and merge sort

ALGORITHM

- 1 start
- 2 enter choice for choosing between entry, display, quick sort and merge sort
- 3 case 1: entry
 - 3.1 Read size of array n
 - 3.2 Repeat for $i = 0$ to n
 - 3.2.1 Read $a[i]$
- 4 case 2: Display
 - 4.1 Repeat for $i = 0$ to N
 - 4.1.1 Print $a[i]$
- 5 case 3: Quick sort
 - 5.1 Globally initialize $left = 0$, $right = n - 1$
 - 5.2 if $left < right$
 - 5.2.1 set $r = left$, $j = right + 1$, $pivot = a[left]$
 - 5.3 Repeat while $k < j$
 - 5.3.1 do $i++$ while $(a[i] < pivot \text{ and } i \leq right)$
 - 5.3.2 do $j--$ while $(a[j] > pivot \text{ and } j \geq left)$
 - 5.3.3 if $i < j$
 - 5.3.3.1 swap $(a[i], a[j])$

5.3.4 else swap ($a[\text{left}], a[j]$)

5.4 call quicksort ($a, \text{left}, j-1$), jump to step 5.2

5.5 call quicksort ($a, j+1, \text{right}$) jump to step 5.2

6 case 4: merge sort

6.1 Globally initialize $\text{beg} = 0, \text{end} = n-1$

6.2 if $\text{beg} < \text{end}$

6.3 ~~6.~~ set $\text{mid} = (\text{beg} + \text{end}) / 2$

6.4 call merge sort ($a, \text{beg}, \text{mid}$), jump to step 6.3

6.5 call mergesort ($a, \text{mid}+1, \text{end}$) jump to step 6.3

6.6 call merge ($a, \text{beg}, \text{mid}, \text{end}$)

6.6.1 initialize $i = \text{beg}, j = \text{mid}+1, \text{index} = 0$

6.6.2 Repeat while ($i \leq \text{mid}$) and ($j \leq \text{end}$)

6.6.2.1 if $a[i] < a[j]$

6.6.2.1.1 set $\text{temp}[\text{index}++] = a[i++]$

6.6.2.2 else set $\text{temp}[\text{index}++] = a[j++]$

6.6.3 if $i > \text{mid}$

6.6.3.1 Repeat while $j \leq \text{end}$

6.6.3.1.1 set $\text{temp}[\text{index}++] = a[j++]$

6.6.4 else

6.6.4.1 Repeat while $i \leq \text{mid}$

6.6.4.1.1 set $\text{temp}[\text{index}++] = a[i++]$

7 STOP

CONCLUSION

The program has been executed correctly and output has been verified
